Clarification:

- 0/0010 A service segment starting and uniquely identifying a message. The message type code for the Application error and acknowledgement message is APERAK. Note: Application error and acknowledgement messages conforming to this document must contain the following data in segment UNH, composite S009: Data element 0065 APERAK 0052 D 0054 04A 0051 UN
- 0/0020 A segment to indicate the type and function of the message and to transmit the identifying number.
- 0/0030 A segment to specify related date/time.
- 0/0040 A segment to specify free form or processable supplementary information related to the whole message. In computer-to-computer exchanges free form text will normally require the receiver to process this segment manually.
- 0/0090 A group of segments to specify the document/message to which the current message relates, and related date and time.
- 0/0100 A segment to indicate the reference number of the document/message.
- 0/0120 A group of segments to specify the identifications of message sender and message receiver with their contacts and communication channels.
- 0/0130 A segment to specify the identification of the message issuer and message receiver.
- 0/0160 A group of segments to identify the application error(s) within a specified received message and to give specific details related to the error type or to precise the type of acknowledgement.
- 0/0170 A segment identifying the type of application error or acknowledgement within the referenced message. In case of an error, the error code may specify the error in detail (e.g. a measurement relating to a piece of equipment is wrong) or as a rough indication (e.g. a measurement is wrong).
- 0/0190 A group of segments to specify the functional entity reference (e.g. goods item level, equipment level) relating to the specified error; further details can be added to identify the error more precisely.
- 0/0200 A segment to provide a reference relating to the acknowledgement type or the specified error (e.g. functional entity reference such as equipment level).
- 0/0210 A segment to provide additional details relating to the reference, e.g. the content of the wrong data (and its exact place in the message).
- 0/0220 A service segment ending a message, giving the total number of segments in the message (including the UNH & UNT) and the control reference number of the message.
